

The results of developing the Retrieval-Augmented Generation (RAG) architecture for the ITNB website widget are highly promising, demonstrating success across the entire pipeline from data acquisition to final output generation. The initial phase, focused on data collection from the website, was successfully executed. The relevant information, including all internal links and deep sub-sections, was extracted and stored in the Markdown file, `itnb_content.md`. This deep crawl capability is highly beneficial as it allows the RAG system to perform comprehensive deep searches across the full scope of the company's content. The generated knowledge base is substantial, consisting of almost 600,000 tokens ingested and stored in GroundX (*Fig 1*).

Fig. 1: GroundX Bucket Content with database

The final RAG functionality is performing effectively. As demonstrated in the terminal screenshots (*Figs. 2,3*), when a general question is asked, the system provides a correct, detailed, and developed answer that is consistently based on the content of the ingested website. Furthermore, the system successfully provides the accurate source link following the answer, indicating that the retrieval step is effectively mapping the generated text back to its origin.

*Fig. 2: Q: What is the Sovereign Orchestrator from ITNB?

```

Ask something: What is the Sovereign Cloud?
Searching in database...
The Sovereign Cloud is a Swiss cloud platform that offers availability, reliability, scalability, and security. It is built on enterprise-grade hardware and guarantees 99.99% uptime, ensuring regulatory compliance. The Sovereign Cloud provides infrastructure services such as CPU and GPU compute, storage, networking, databases, virtual machines (VMs), virtual private clouds (VPCs), single sign-on (SSO), code and secret management, Kubernetes, and native integration with Red Hat OpenShift and OpenShift AI.

For more information, you can visit the [Sovereign Cloud page](https://www.itnb.ch/en/products-and-services/infrastructure-as-a-service/sovereign-cloud).

Ask something: Which Model Unit Plans can I choose?
Searching in database...
You can choose from three Model Unit plans:

1. Exploratory: For first-time users or small budgets, starting at CHF 25/mo.
2. Standard: The balanced choice for consistent usage, starting at CHF 100/mo.
3. Scale Up: Built for high-demand applications, starting at CHF 1,000/mo.

You can find more information and purchase these plans at https://console.itnb.ch/en/products/categories/CLOUD_MAAS_BUDGET.

Ask something: Who is the CEO of ITNB?
Searching in database...
The CEO of ITNB is Nicolai Brignoli. He has over 30 years of experience in IT Security, Cloud, and IT Infrastructure, and is a seasoned leader in risk management. For more information, you can visit the ITNB website: https://www.itnb.ch/en.

```

Fig. 3: Different questions with corresponding answers and web links

Finally, *Figure 4* confirms that the System Prompt was correctly configured to ensure the LLM relies exclusively on the provided context and does not incorporate external or pre-trained knowledge, validating that the answers are strictly limited to the database included in the RAG architecture.

```

Ask something: Who is Obama?
Searching in database...
I do not have that information in my database.

```
